

Universidad Nacional Autónoma de Nicaragua

UNAN-León

Facultad de Ciencias y Tecnología

Departamento de Computación

Ingeniería en Telemática

V año

Componente: Laboratorio de Redes de Área Extensa

Tema: Practica de MPLS

Realizado por:

Br. Jhonatan Uziel Espinoza Ortega

Carnet: 15-00737-0

Dirigido a:

M.Sc. Aldo Martínez

León, Nicaragua lunes 8 de julio del 2019.

Contenido

1. Comunicación entre pc1 y pc2 a través de MPLS	3
2. Fusión de etiquetas: Comunicación entre pc3 y pc2 a través de MPLS	12
3. Etiquetas con ámbito de interfaz: Comunicación entre pc3 y pc4 a través de MPLS	16
4. Túnel: apilar etiquetas MPLS	19

1. Comunicación entre pc1 y pc2 a través de MPLS

Comprueba que no funciona un ping desde pc1 a pc2, ya que los routers no tienen configurada ninguna ruta, salvo a las subredes a las que están directamente conectados.

```

pc1:~# ping 17.0.0.20
PING 17.0.0.20 (17.0.0.20) 56(84) bytes of data.
From 11.0.0.1 icmp_seq=1 Destination Net Unreachable
From 11.0.0.1 icmp_seq=2 Destination Net Unreachable
From 11.0.0.1 icmp_seq=3 Destination Net Unreachable
From 11.0.0.1 icmp_seq=4 Destination Net Unreachable
From 11.0.0.1 icmp_seq=5 Destination Net Unreachable
^C
--- 17.0.0.20 ping statistics ---
5 packets transmitted, 0 received, +5 errors, 100% packet loss, time 4035ms
pc1:~#

pc2:~# ping 11.0.0.10
PING 11.0.0.10 (11.0.0.10) 56(84) bytes of data.
From 17.0.0.4 icmp_seq=1 Destination Net Unreachable
From 17.0.0.4 icmp_seq=2 Destination Net Unreachable
From 17.0.0.4 icmp_seq=3 Destination Net Unreachable
From 17.0.0.4 icmp_seq=4 Destination Net Unreachable
From 17.0.0.4 icmp_seq=5 Destination Net Unreachable
^C
--- 11.0.0.10 ping statistics ---
5 packets transmitted, 0 received, +5 errors, 100% packet loss, time 4020ms
pc2:~#

```

1.1 Configura los scripts MPLS para que pc1 y pc2 puedan intercambiarse tráfico utilizando una red MPLS a través de r1 - r2 - r3 - r4. En cada salto MPLS, los routers utilizarán una etiqueta diferente a la recibida. Todas las etiquetas de un router pertenecerán al mismo ámbito (labelspace=0).

Incluye los scripts en la memoria, explicando los números de etiquetas que has utilizado en cada interfaz y sentido de la comunicación.

De PC1 a PC2

```
r1:~# cat derecha.sh
#!/bin/sh

echo "Envio a 17.0.0.0/24"

```

En el paquete 1, de la captura 1 realizada en R2 eth1 donde la etiqueta en el sentido de ida es 10002, podemos ver efectivamente que al ser enviado el paquete por R2 la etiqueta que tiene es la 10002.

En la siguiente captura siguiendo la secuencia del mensaje enviado, se puede ver que en R3 se cambio la etiqueta a 10003 a como se puede observar en la captura. De esta misma manera ocurre en el otro sentido de la comunicación.

1.3 Observa los paquetes cuyo origen es pc1 en ambas capturas, fijate en el campo TTL de las cabeceras IP y MPLS. Explica sus valores.

Captura 01

MPLS Label (mpls.label), 4 bytes Packets: 10 · Displayed: 10 (100.0%) Profile: Default

En la 01 captura en la cabecera IP el TTL del mensaje en todo el camino es de 63, y de la cabecera MPLS es de 62, en la captura 02 el TTL de la cabecera IP sigue siendo 63 y en la cabecera MPLS ahora es 61.

1.4 Explica con qué TTL pc2 recibirá los paquetes que envía pc1.

Con un TTL de 62.

1.5 Muestra las tablas NHLFE, XC, ILM e ip route en cada router e indica para cada sentido de la comunicación qué entrada de cada tabla se ha utilizado en cada salto para el envío de un paquete de pc1 a pc2 y de pc2 a pc1.

```

Explica el resultado de ambas capturas. ¿Qué crees que ocurriría si se transmitieran estos paquetes de ping en una red IP en la que no se utilizara MPLS?

Captura en R1

The capture shows traffic on the interface 0e:ab:f8:0c:10:4b. The packet list includes:

- 1. 0.000000 11.0.0.10 → 17.0.0.20 ICMP 1514 Echo (ping) request id=0x5802, seq=1/256, ttl=64 (no response f...
- 2. 0.000179 11.0.0.10 → 17.0.0.20 ICMP 590 Destination unreachable (Fragmentation needed)
- 3. 1.018282 11.0.0.10 → 17.0.0.20 IPv4 1506 Fragmented IP protocol (proto=ICMP 1, off=0, ID=3a7d) [Reassembl...
- 4. 1.018287 11.0.0.10 → 17.0.0.20 ICMP 42 Echo (ping) request id=0x5802, seq=2/512, ttl=63 (reply in 5)
- 5. 1.056392 17.0.0.20 → 11.0.0.10 ICMP 1514 Echo (ping) reply id=0x5802, seq=2/512, ttl=60 (request in 4)
- 6. 2.028305 11.0.0.10 → 17.0.0.20 IPv4 1506 Fragmented IP protocol (proto=ICMP 1, off=0, ID=3a7e) [Reassembl...
- 7. 2.028310 11.0.0.10 → 17.0.0.20 ICMP 42 Echo (ping) request id=0x5802, seq=3/768, ttl=63 (reply in 8)
- 8. 2.029578 17.0.0.20 → 11.0.0.10 ICMP 1514 Echo (ping) reply id=0x5802, seq=3/768, ttl=60 (request in 7)
- 9. 4.996407 0e:ab:f8:0c:10:4b → 6e:5f:98:37:0c:07 ARP 42 Who has 11.0.0.10? Tell 11.0.0.1
- 10. 4.996867 6e:5f:98:37:0c:07 → 0e:ab:f8:0c:10:4b ARP 42 11.0.0.10 is at 6e:5f:98:37:0c:07

The packet details for the selected packet (Frame 3) show:

- Ethernet II, Src: 6e:5f:98:37:0c:07 (6e:5f:98:37:0c:07), Dst: 0e:ab:f8:0c:10:4b (0e:ab:f8:0c:10:4b)
- Internet Protocol Version 4, Src: 11.0.0.10, Dst: 17.0.0.20
- 0100 = Version: 4
- 0101 = Header Length: 20 bytes (5)
- Differentiated Services Field: 0x00 (DSCP: CS0, ECN: Not-ECT)
- Total Length: 1492
- Identification: 0x3a7d (14973)
- Flags: 0x2000, More fragments
- Time to live: 64
- Protocol: ICMP (1)
- Header checksum: 0xfe8e [validation disabled]
- [Header checksum status: Unverified]
- Source: 11.0.0.10
- Destination: 17.0.0.20
- Reassembled IPv4 in frame: 4
- Data (1472 bytes)

Captura en R2

The capture shows traffic on the interface fa:de:dc:30:96:57. The packet list includes:

- 1. 0.000000 fa:de:dc:30:96:57 → Broadcast ARP 42 Who has 12.0.0.2? Tell 12.0.0.1
- 2. 0.000104 3a:40:ee:31:9e:cd → fa:de:dc:30:96:57 ARP 42 12.0.0.2 is at 3a:40:ee:31:9e:cd
- 3. 0.000176 11.0.0.10 → 17.0.0.20 IPv4 1510 Fragmented IP protocol (proto=ICMP 1, off=0, ID=3a7d) [Reas...
- 4. 0.000181 11.0.0.10 → 17.0.0.20 ICMP 46 Echo (ping) request id=0x5802, seq=2/512, ttl=63 (reply in 5)
- 5. 0.027125 17.0.0.20 → 11.0.0.10 IPv4 1510 Fragmented IP protocol (proto=ICMP 1, off=0, ID=76c3) [Reas...
- 6. 0.027145 17.0.0.20 → 11.0.0.10 ICMP 46 Echo (ping) reply id=0x5802, seq=2/512, ttl=63 (request in 4)
- 7. 0.999446 11.0.0.10 → 17.0.0.20 IPv4 1510 Fragmented IP protocol (proto=ICMP 1, off=0, ID=3a7e) [Reas...
- 8. 0.999451 11.0.0.10 → 17.0.0.20 ICMP 46 Echo (ping) request id=0x5802, seq=3/768, ttl=63 (reply in 9)
- 9. 1.000387 17.0.0.20 → 11.0.0.10 IPv4 1510 Fragmented IP protocol (proto=ICMP 1, off=0, ID=76c4) [Reas...
- 10. 1.000405 17.0.0.20 → 11.0.0.10 ICMP 46 Echo (ping) reply id=0x5802, seq=3/768, ttl=63 (request in 8)

The packet details for the selected packet (Frame 3) show:

- Ethernet II, Src: fa:de:dc:30:96:57 (fa:de:dc:30:96:57), Dst: 3a:40:ee:31:9e:cd (3a:40:ee:31:9e:cd)
- MultiProtocol Label Switching Header, Label: 10001, Exp: 0, S: 1, TTL: 63

- Time to live: 63
- Protocol: ICMP (1)
- Header checksum: 0xff8e [validation disabled]

Debido a que MPLS no puede manejar la fragmentación, si un paquete tiene que ser fragmentado, solo en el primer fragmento quedarían todas las etiquetas intactas. Por lo cual el resto se perdera.

2. Fusión de etiquetas: Comunicación entre pc3 y pc2 a través de MPLS

Cuando dos máquinas están enviando tráfico a un mismo destino, en algún punto del camino la ruta que siguen los paquetes de cada una de las dos máquinas origen puede solapar hasta llegar al destino. En la parte del camino en la que solapan, MPLS puede utilizar las mismas etiquetas para que los paquetes alcancen el destino. Por ejemplo en la figura 2 si hay tráfico dirigido a la subred 14.0.0.0/24 desde r1 y desde r4, en el tramo r2 → r3 todo el tráfico dirigido a esa subred puede compartir la etiqueta 10002, siendo que parte del tráfico traía etiqueta 10001 y otra parte 20001.

2.1 Realiza las mínimas modificaciones necesarias en los scripts MPLS del apartado 1 para que pc3 pueda intercambiar tráfico con pc2. Ten en cuenta la siguiente consideración:

En el camino común que comparten pc1 → pc2 y pc3 → pc2 debes reutilizar la configuración de etiquetas existente.

Los valores de las nuevas etiquetas que tengas que introducir en este apartado deberán ser diferentes de los ya utilizados.

En cada salto MPLS los routers deberán utilizar una etiqueta diferente a la recibida.

Todas las etiquetas de un router deberán pertenecer al mismo ámbito (labelspace 0).

Incluye los scripts que hayas modificado en la memoria, explicando las modificaciones.

De PC3 a PC2

The image shows two terminal windows, one for router r2 and one for router r3, both running GNU nano 2.0.7. The r2 window shows the configuration of label 10001 and key 10002 for traffic from 11.0.0.0/24, and key 20001 for traffic from 14.0.0.0/24. The r3 window shows the configuration of label 10002 and key 10003 for traffic from 11.0.0.0/24, and label 20001 and key 10001 for traffic from 14.0.0.0/24. Both windows have a status bar at the bottom showing various keyboard shortcuts.

MPLS Label (mpls.label), 4 bytes Packets: 22 · Displayed: 22 (100.0%) Profile: Default

3. Etiquetas con ámbito de interfaz: Comunicación entre pc3 y pc4 a través de MPLS

3.1 Piensa en qué modificaciones tendrías que realizar para que pc3 y pc4 pudieran intercambiar tráfico, sin usar túnel. Explica en qué lugares podrías aplicar la técnica de fusión de etiquetas realizada en 2.

3.2 Modifica los scripts del apartado 2 para permitir la comunicación entre pc3 y pc4. Si es necesario crear nuevos scripts en otras máquinas, hazlo. Ten en cuenta las siguientes consideraciones:

Debes utilizar cuando sea posible la técnica de la fusión de etiquetas.

Los valores de las nuevas etiquetas que introduzcas en este apartado deberán ser diferentes de los ya utilizados.

Todos los routers deberán utilizar el labelspace 0 para definir etiquetas con ámbito de router, excepto en r4 que deberá utilizar etiquetas con ámbito de interfaz.

Para que resulte necesario utilizar etiquetas con ámbito de interfaz en r4, obliga a que r5 envíe a r4 para alcanzar la 14.0.0.0/24 la misma etiqueta que ya has utilizado en r3 cuando envía a r4 para alcanzar la

17.0.0.0/24. De esta forma te resultará necesario que en r4 los mismos valores de etiquetas recibidos a través de interfaces diferentes sean tratados como etiquetas diferentes.

Incluye los scripts que hayas modificado/creado en la memoria, explicando las modificaciones.

NHLFE entry key 0x00000002 mtu 1496 propagate_ttl
    push gen 30003 set eth1 ipv4 16.0.0.5 (672 bytes, 8 pkts)
r4:~#

```

4 Túnel: apilar etiquetas MPLS

4.1 Vamos a configurar un túnel MPLS entre r2 y r4 en ambos sentidos:

En el sentido $r2 \rightarrow r3 \rightarrow r4$: Todo el tráfico que tiene que reenviar r2 de pc1 y pc3 irá encapsulado con una cabecera adicional MPLS. En r3 se mantendrá la cabecera adicional realizando el swap de etiquetas. En r4 se eliminará la cabecera adicional, realizando el reenvío basado en la cabecera MPLS más interna.

En el sentido $r4 \rightarrow r3 \rightarrow r2$: Todo el tráfico que tiene que reenviar r4 de pc2 y pc4 irá encapsulado con una cabecera adicional MPLS. En r3 se mantendrá la cabecera adicional realizando el swap de etiquetas. En r2 se eliminará la cabecera adicional, realizando el reenvío basado en la cabecera MPLS más interna.

Modifica los scripts de las máquinas que consideres necesario para que implementen el túnel descrito. Incluye los nuevos scripts en la memoria.

De ida

Frame 3: 98 bytes on wire (784 bits), 98 bytes captured (784 bits)
 Ethernet II, Src: 8e:49:ea:71:64:6b (8e:49:ea:71:64:6b), Dst: 2e:18:cc:d4:8c:e7 (2e:18:cc:d4:8c:e7)
 Internet Protocol Version 4, Src: 11.0.0.10, Dst: 17.0.0.20
 0100 = Version: 4
 0101 = Header Length: 20 bytes (5)
 Differentiated Services Field: 0x00 (DSCP: CS0, ECN: Not-ECT)
 Total Length: 84
 Identification: 0x0000 (0)
 Flags: 0x4000, Don't fragment
 Time to live: 60
 Protocol: ICMP (1)
 Header checksum: 0x228c [validation disabled]
 [Header checksum status: Unverified]
 Source: 11.0.0.10
 Destination: 17.0.0.20
 Internet Control Message Protocol

0010 00 54 00 00 40 00 8c 01 22 8c 0b 00 00 0a 11 00 ..T..@.. ".....

Time to live (ip.ttl), 1 byte

Packets: 14 · Displayed: 14 (100.0%) Profile: Default

4.4 ¿Cuál sería la cantidad máxima de datos IP que podrían atravesar el túnel sin fragmentación?
